The report requires updating with new data and is sent in 48 hours after order is placed.

PCB Photosensitive Dry Film is a thin, photosensitive material used in the manufacturing of printed circuit boards (PCBs). It is applied to the surface of a PCB substrate and then exposed to ultraviolet (UV) light through a photomask, which transfers a precise circuit pattern onto the film. The exposed areas harden, while the unexposed areas remain soft and can be developed away, revealing the desired circuitry. This film is crucial for creating fine, intricate patterns on PCBs with high precision and is widely used in both prototyping and mass production of electronic devices.

The global PCB Photosensitive Dry Film market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
