The global PCB Plating Equipment market size is predicted to grow from US\$ million in 2025 to US\$ million in 2031; it is expected to grow at a CAGR of %from 2025 to 2031.

In the printed circuit board, copper is used to interconnect components on a substrate , although it is to form a conductive path printed circuit board graphics board good conductor material , but if prolonged exposure to air , but also it is easy to lose luster due to oxidation , corrosion and loss suffered due weldability . Therefore, you must use a variety of techniques to protect the copper traces , vias , and plated through holes , such techniques include the organic coating, the oxide film and plating techniques .

Metal plating or coating process is to ensure weldability and corrosion protection circuit to avoid the standard operation, the circuit board manufacturing plays an important role in the single-sided , double-sided and multilayer printed . In particular, the plating layer having a printed line of the weld metal has become a solder protective layer provided for the operation of a standard copper tracks .

Development occurs in electroplating , through the development of automated computer -controlled plating equipment , conduct chemical analysis of organic and metallic additives in highly complex instrument technology, and precise control of the chemical reaction process technology, electroplating technology to achieve a high level.

According to our Semiconductor Research Center, the global total output value of PCB was about US\$ 81 billion in 2022. With strong drivers from new technology, such as AI, 5G and new energy vehicles, it is estimated that the PCB industry will continue to grow

steadily in the next six years. Global PCB manufacturers are mainly located in China mainland, China Taiwan, Japan, South Korea, Europe and the United States. Among them, Chinese local PCB companies hold the biggest share.
