According to this study, the global PCB Wet Cleaning market size will reach US$ 3730 million by 2031.

PCB wet cleaning is a process used to clean printed circuit boards (PCBs) by using liquid cleaning agents. This method involves immersing the PCBs in a cleaning solution or spraying the solution onto the boards to remove contaminants such as solder flux, grease, dust, and other residues. The cleaning solution may contain various chemicals depending on the type of contaminants to be removed. For example, aqueous solutions with detergents or solvents are commonly used. After the cleaning process, the PCBs are usually rinsed with clean water to remove the remaining cleaning agent and then dried to prevent water spots or other damage. PCB wet cleaning is an important step in PCB manufacturing and assembly to ensure the reliability and performance of the boards by maintaining good electrical insulation and preventing corrosion.

United States market for PCB Wet Cleaning is estimated to increase from US$ million in 2024 to US$ million by 2031, at a CAGR of % from 2025 through 2031.

China market for PCB Wet Cleaning is estimated to increase from US$ million in 2024 to US$ million by 2031, at a CAGR of % from 2025 through 2031.
