Nano-coating is a transparent thin film nano-coating with a thickness of about one thousandth of the diameter of a human hair. The low-convex surface of the nano-coating can absorb the surrounding gas molecules to form a stable thin film air cushion, which avoids direct contact between the metal materials of the PCB surface and the component pins and water molecules. A very fine mesh film layer is formed on the PCB surface, which effectively reduces the surface energy of the circuit board and electronic components, making the contact angle of water droplets deposited on the PCB surface tend to a larger value, and the PCB surface presents a strong super-hydrophobic property.

The global PCBA Nano-coating market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
