Abstracts

The global PCIe Digital I/O Card market size is predicted to grow from US\$ 234 million in 2025 to US\$ 361 million in 2032; it is expected to grow at a CAGR of 6.4% from 2026 to 2032.

Global shipments of PCIe Digital I/O Cards are projected to reach approximately 1.1 million cards by 2025, priced around \$218 per card. Primary demand comes from industrial automation control systems, process industry PLC expansion, rail transit signaling and onboard equipment, energy and power monitoring systems, and test and measurement platforms. The Asia-Pacific market accounts for approximately 45%–50%, with Taiwan, Japan, and mainland China being the main markets for manufacturing and system integration. Product prices vary depending on isolation method (optical/capacitive/magnetic isolation), number of channels (8/16/32/64 DI/DO), withstand voltage rating (2.5kVrms–5kVrms), and certification requirements (CE/UL/EN 61010/rail transit standards). High-isolation, high-consistency models targeting rail transit, energy, and high-reliability testing systems can reach prices as high as \$280–420 per card. From an equipment configuration perspective, a single PLC expansion rack or IPC control system typically uses 1-2 PCIe digital I/O cards for critical switching signals. In scenarios with multiple field loops, long cables, or strong electromagnetic interference (such as at the end of a production line, in areas with dense inverters, or in vehicle systems), 3-6 isolated cards are commonly deployed in parallel. These products are basic functional components in the system, with a small number of points but extremely high safety weight. Their value lies not in throughput or refresh rate, but in avoiding the risks of false triggering, cascading damage, and system-level downtime. PCIe digital I/O cards are industrial I/O expansion modules that completely electrically isolate field-side digital signals from the control logic side through optocouplers, digital isolators, or isolated power supplies. They are mainly used to safely connect switching signals from sensors, buttons, relays, proximity switches, etc., to PLCs, IPCs, or embedded control systems. Their core function is not 'more points,'

but rather to serve as a safety buffer layer in high-noise, high-voltage-difference, and complex grounding environments.
