Abstracts

The global PDE-3 Inhibitors market size is predicted to grow from US$ 667 million in 2025 to US$ 926 million in 2032; it is expected to grow at a CAGR of 4.9% from 2026 to 2032.

PDE-3 inhibitors are a class of drugs that inhibit phosphodiesterase-3 activity, thereby increasing intracellular cAMP levels in cardiac muscle cells, producing positive inotropic and vasodilatory effects. They are primarily used in the treatment of acute heart failure, cardiogenic shock, and certain peripheral vascular conditions. The upstream supply chain relies on high-purity active pharmaceutical ingredients (APIs) and fine chemical intermediates, largely produced by manufacturers in Europe, the U.S., and India, such as Lonza, Evonik, and Dr. Reddy's. Formulation requires high-quality excipients and strict sterile processing, with common excipients like lactose, hydroxypropyl methylcellulose, and microcrystalline cellulose supplied by global excipient leaders.

Downstream applications are concentrated in hospitals, particularly cardiology departments and intensive care units (ICUs), with end customers including large tertiary hospitals, specialized cardiac centers, and emergency care providers. With the rising global burden of cardiovascular diseases and the growing incidence of acute heart failure in aging populations, demand for PDE-3 inhibitors remains steady. However, their usage is somewhat constrained by potential side effects and competition from more advanced therapeutic alternatives.

In 2024, the global average price of PDE-3 inhibitors is approximately USD 5.7 per unit (with “unit” defined as either one oral tablet or one injection ampoule), and the total sales volume reaches about 115 million units.

United States market for PDE-3 Inhibitors is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.
