According to our (LP Info Research) latest study, the global PE Breathable Film market size was valued at US\$ million in 2022. With growing demand in downstream market and recovery from influence of COVID-19 and the Russia-Ukraine War, the PE Breathable Film is forecast to a readjusted size of US\$ million by 2029 with a CAGR of % during review period.

The research report highlights the growth potential of the global PE Breathable Film market. With recovery from influence of COVID-19 and the Russia-Ukraine War, PE Breathable Film are expected to show stable growth in the future market. However, product differentiation, reducing costs, and supply chain optimization remain crucial for the widespread adoption of PE Breathable Film. Market players need to invest in research and development, forge strategic partnerships, and align their offerings with evolving consumer preferences to capitalize on the immense opportunities presented by the PE Breathable Film market.

PE breathable film is a new type of breathable and impermeable material. In the production process of polyethylene, some 4-carbon or 8-carbon α -olefins are added as comonomers, but because α -olefins are rarely used, polyethylene Ethylene also maintains many properties, and the main component of PE breathable film is polyethylene. It is made of LDPE/LLDPE polyethylene resin carrier, adding about 50% of special calcium carbonate for blending, extruding and stretching to a certain ratio after forming a film. There are two main processing methods, one is flat film Casting method, the other is blown film method. In China and even Asia, most of Europe and the United States use casting method. The main process flow of tape casting method is as follows: PE raw material + porogen α mixing and metering α extrusion granulation α extrusion casting α stretching and setting α cooling α trimming α coiling. Throughout the

process, the effect of the stretching process on the properties of the film is very important. During stretching, when the binding force of the porogen CaCO₃ particle and its surrounding PE polymer is less than the deformation force of the PE polymer caused by stretching, the polymer will separate along the edge of the CaCO₃ particle, resulting in some Tiny cavities, liquid molecules cannot pass through these cavities, only gaseous molecules can pass through, so the stretched film has waterproof and breathable properties. The size of the void can be adjusted according to the process conditions such as the size, form, stretching method, and stretching ratio of CaCO₃ particles. When the stretching temperature reaches a certain value, as the stretch ratio increases, the pore size of the PE breathable film increases, the air permeability increases, and the stretch performance deteriorates; as the thickness increases, the air permeability decreases.

PE breathable membrane is mainly used in the fields of protective clothing, diapers and feminine sanitary napkins. With the outbreak of the new crown epidemic, the polyethylene (PE) breathable film special material industry has been further developed. It is expected that in the next few years, the supply of special materials for polyethylene (PE) breathable film industry will show a growing trend year by year
