The pore size of the PE battery separator is small and the porosity is high. The porosity affects the resistance and the amount of acid absorption is an important parameter. Its working principle is that the filler silica in the separator is uniformly mixed with PE through the mixing system, and at the same time absorbs a large amount of oil. After

the separator is extruded, the oil is extracted by the extractant. The part of the oil occupied Micropores are formed in the space, and the oil content of the formed separator is about 14. When the PE separator is used, it is soaked in sulfuric acid for a long time, and part of the oily substance of the separator is leached.
