PEALD system is a system that enhances the reaction process by introducing plasma during the atomic layer deposition (ALD) process. The system uses plasma to activate gas molecules and deposit thin films layer by layer on the surface, achieving precise control of the film and excellent film quality. Compared with traditional ALD technology, PEALD introduces plasma during the deposition process, which can provide sufficient energy to activate the reactive gas molecules and promote surface chemical reactions. Due to the effect of plasma, PEALD can increase the deposition rate of the film and achieve a lower deposition temperature while ensuring the high quality of the film. PEALD technology can prepare thin films of various inorganic, organic and mixed materials with high deposition uniformity and low defect density.
