The global Pedal Position Sensors market size is predicted to grow from US\$ 1722 million in 2025 to US\$ 2712 million in 2032; it is expected to grow at a CAGR of 6.7% from 2026 to 2032.

In 2025, global Pedal Position Sensor output reached about 220 million units and global capacity of around 260 million units. The average price is about USD 8 per unit, with gross margins near 29%. Pedal Position Sensor are electronic devices used in vehicles to measure the position and movement of the accelerator, brake, or clutch pedal and convert the mechanical motion into electrical signals for the vehicle's electronic control unit (ECU). These sensors are critical in drive-by-wire systems, electric vehicles, advanced driver assistance systems (ADAS), and engine management, enabling precise throttle control, regenerative braking coordination, cruise control, and safety monitoring. Most pedal position sensors use Hall-effect, inductive, magnetoresistive, or potentiometric sensing technologies and are designed for high durability, low latency, and functional safety compliance such as ISO 26262. The supply chain begins with upstream raw materials and components including semiconductor ICs, magnets, copper coils, engineering plastics, connectors, and PCB substrates supplied by electronic material companies and chip manufacturers. Midstream activities involve sensor design, PCB assembly, molding, calibration, software integration, and module manufacturing by automotive sensor suppliers and Tier-1 component makers. Downstream customers include passenger vehicle OEMs, commercial vehicle manufacturers, EV producers, agricultural machinery companies, and industrial equipment makers, where the sensors are integrated into pedal modules and vehicle control systems for combustion, hybrid, and electric platforms.
