The pedal spot welding machine adopts the principle of double-sided double-point overcurrent welding. When working, the two electrodes press the workpiece so that the two layers of metal form a certain contact resistance under the pressure of the two electrodes, and the welding current flows from one electrode to the other. When an electrode is selected, an instantaneous thermal fusion is formed at the two contact resistance points, and the welding current flows from the other electrode to the electrode along the two workpieces to form a loop without damaging the internal structure of the welded workpiece.
