## Abstracts

The global Pedestrian Security Gate market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

Pedestrian Security Gates are physical barriers or access control systems designed to regulate and restrict pedestrian movement in order to enhance security in various settings. These gates are typically installed in entrances or exits of buildings, transportation hubs, stadiums, or other high-security areas. They can be manual or automated, featuring a range of technologies such as turnstiles, flap barriers, swing gates, or speed gates. Pedestrians must present valid credentials, such as access cards or biometric identification, to gain authorized entry through these gates, effectively preventing unauthorized access and ensuring controlled flow of individuals.

The industry trend of Pedestrian Security Gates is focused on integrating advanced technologies for enhanced security and user experience. Increasingly, these gates are incorporating biometric authentication methods like fingerprint or facial recognition, making access control more efficient and secure. There is also a move towards seamless integration with other security systems, such as CCTV cameras or visitor management software, to provide a comprehensive security solution. Additionally, the development of contactless access technologies, like RFID or smartphone-based solutions, is gaining traction in the industry, providing a more convenient and touch-free experience for users.
