Pediatric Oxygen Nasal Cannula is the medical device used in the conditions of respiratory help for delivering supplemental oxygen or increased airflow to a patient in need. The oxygen concentration and flow rates can vary among different product types. Nowadays, there are several product types available in the nasal as per the age and size requirements. For pediatric use, nasal cannula with smaller prongs are used which carries 0.5-1 litre of oxygen per minute for neonates, 1-2 litre of oxygen for infants and 1-4 litre of oxygen for older children. These pediatric nasal cannula devices are comparatively soft and gentle to delicate facial skin of infants. The device is made of a lightweight tube which can be easily hooked up around the patients' ears. One end of the tube are placed inside the nostrils and the other end is connected to the oxygen concentrator. Sometimes, there exists a slight risk of airway obstruction by mucus. Pediatric nasal cannula is helpful in providing the right amount of oxygen to the children which requires low-flow oxygen therapy. Hypoxaemia occurs frequently in children suffering from pneumonia, trauma or perioperative injuries and other neonatal conditions. Insufficient amount of oxygen is the major cause of death in pneumonic children which causes death of 1.3 million in 2010. This generates the need of adequate supply for respiratory consumables such as pediatric nasal cannula.
