Posterior dynamic stabilization (PDS) systems are preservation devices that are designed for the treatment of persistent low back pain. These devices support the spinal cord and help to avoid abnormal motion load distribution in the back. They are also termed as motion preservation devices, as they help to streamline the motion of the certain parts of human body. The pedicle screw-based flexible devices are designed to control motion and load bearing of the motion to cure the resultant back pain. The disintegration of disc due to excessive weight, mechanical injuries, and others has fueled the need for pedicle screw-based dynamic stabilization systems.
