The global PEEK Bearing for Semiconductors market size is predicted to grow from US\$ 110 million in 2025 to US\$ 191 million in 2032; it is expected to grow at a CAGR of 8.4% from 2026 to 2032.

PEEK bearings for semiconductors typically refer to bearings and guides made of PEEK or PEEK based composite materials as the main body, cage, or self-lubricating layer in wafer manufacturing, packaging, testing, and related ultra clean process equipment. These bearings are used for key motion pairs such as rotary tables, wafer transfer robots, vacuum pumps and dry pumps, chemical pumps, valves, and conveying mechanisms in vacuum chambers. Compared to traditional metal bearings and general plastic bearings, they focus on providing low particle release, low gas evolution, non-metallic, and plasma/chemical corrosion resistance capabilities, while also considering lubrication free or low lubrication characteristics. In 2024, global PEEK Bearing for Semiconductors production reached approximately 8.36 M Units, with an average global market price of around US\$ 12.38 per unit.

The annual production capacity of the PEEK bearings for semiconductors is 12 M Unit, and the gross profit margin is generally in the range of 35% to 50%. Upstream raw materials mainly include suppliers of electronic-grade or high-purity PEEK resin and modified particles, manufacturers of fillers and lubricating and wear-resistant additives, and suppliers of precision stainless steel or ceramic parts. Downstream, it directly connects with semiconductor front-end and back-end equipment factories (etching machines, CVD/ALD, PVD, cleaning machines, CMP, glue development, wafer transfer systems, etc.), dry vacuum pump and chemical liquid pump factories, and some automation equipment companies for ultra-clean environments. Through these complete machines and integrators, it finally enters the wafer factory and packaging and

testing factory. From the perspective of cost structure, high-purity PEEK resin and modified materials, metal or ceramic accessories usually account for 45% to 60% of the total cost, precision processing and clean cleaning, assembly and online testing account for about 15% to 25%, and the rest is clean workshop and equipment depreciation, process development and customer certification, quality system maintenance, and management and inventory costs caused by small batches and multiple varieties.

From the trend, with the reduction of process line width, the advancement of EUV and high vacuum processes, equipment is becoming increasingly sensitive to particle and metal pollution. The penetration rate of PEEK bearings in vacuum environments, strong corrosion wet processes, CMP and cleaning, gas and chemical transportation and other links continues to increase, showing an evolution from "partial replacement of metal bearings" to "priority selection of high-performance engineering plastic bearings for key moving parts". At the same time, leading equipment manufacturers are more inclined to provide long-term certification and matching with professional suppliers with high-purity PEEK formulas, precision processing and clean packaging capabilities. Localized substitution is also accelerating, making the semiconductor PEEK bearing segment market maintain a small volume, high added value, high certification barriers, and faster growth pace than the overall bearing industry.
