PEEK (Polyether Ether Ketone) cranial and craniofacial implants are advanced medical devices used to repair or reconstruct cranial and facial bone defects resulting from trauma, surgery, or congenital conditions. PEEK is a biocompatible, radiolucent, and highly durable polymer that can be precisely shaped and customized to fit the patient's anatomy. These implants offer several advantages, including lightweight properties, high mechanical strength, and resistance to wear and chemical degradation, making them suitable for long-term implantation. Additionally, PEEK implants do not interfere with imaging techniques like MRI or CT scans, allowing for clear post-operative assessments. Their customizable nature ensures a better fit and integration with the patient's bone structure, enhancing both functional and aesthetic outcomes in cranial and craniofacial surgeries.

The global PEEK Cranial and Craniofacial Implants market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.

As a new type of implant material, PEEK has gradually become favored by doctors and patients in recent years because its use in skull repair and fixation is superior to titanium materials in terms of personalized matching, medical imaging compatibility, physical and mechanical properties, and comfort. However, because PEEK skull repair and fixation products are still in the popularization period and are more expensive than titanium material products, the penetration rate in the field of skull repair is still at a low level.

In the future, with the increase in per capita disposable income, changes in people's medical concepts, and the further promotion of PEEK's excellent performance among doctors and patients, the penetration rate of PEEK skull repair and fixation products is expected to enjoy greater room for improvement.
