PEEK (Polyether Ether Ketone) cranial repair materials are biocompatible, high-performance polymers used in cranial reconstructive surgeries to repair or replace parts of the skull. PEEK is favored for its mechanical properties, which closely mimic those of human bone, including high strength, stiffness, and resistance to wear and impact. Additionally, PEEK is radiolucent, allowing for clear imaging post-surgery without interference, and is also resistant to chemical degradation, making it suitable for long-term implantation. Customizable through 3D printing and milling, PEEK implants can be precisely tailored to match the patient's anatomy, enhancing surgical outcomes and promoting better integration with the surrounding bone and tissues. These attributes make PEEK an ideal material for cranial implants, offering durability, safety, and effectiveness in cranial repair procedures.

The global PEEK Cranial Repair Materials market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.

As a new type of implant material, PEEK has gradually become favored by doctors and patients in recent years because its use in skull repair and fixation is superior to titanium materials in terms of personalized matching, medical imaging compatibility, physical and mechanical properties, and comfort. However, because PEEK skull repair and fixation products are still in the popularization period and are more expensive than titanium material products, the penetration rate in the field of skull repair is still at a low level.

In the future, with the increase in per capita disposable income, changes in people's medical concepts, and the further promotion of PEEK's excellent performance among doctors and patients, the penetration rate of PEEK skull repair and fixation products is expected to enjoy greater room for improvement.
