A PEEK implant for cranial repair is a medical device made from polyether ether ketone (PEEK), a high-performance thermoplastic polymer, used to reconstruct and repair cranial defects or deformities. PEEK implants are custom-designed using 3D imaging and manufacturing technologies to precisely match the patient's anatomy. These implants are chosen for their excellent biocompatibility, durability, and radiolucency, which means they do not interfere with imaging techniques like X-rays or MRI scans. PEEK implants offer several advantages, including reduced risk of infection, minimal thermal conductivity, and the ability to be tailored to complex shapes, making them ideal for cranial reconstruction procedures. They provide a long-term, stable solution for patients requiring cranial repair due to trauma, congenital defects, or surgical resection.

The global PEEK Implant for Cranial Repair market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.

As a new type of implant material, PEEK has gradually become favored by doctors and patients in recent years because its use in skull repair and fixation is superior to titanium materials in terms of personalized matching, medical imaging compatibility, physical and mechanical properties, and comfort. However, because PEEK skull repair and fixation products are still in the popularization period and are more expensive than titanium material products, the penetration rate in the field of skull repair is still at a low level.

In the future, with the increase in per capita disposable income, changes in people's medical concepts, and the further promotion of PEEK's excellent performance among doctors and patients, the penetration rate of PEEK skull repair and fixation products is expected to enjoy greater room for improvement.
