Polyethylene glycol materials have the advantages of solubility, good biocompatibility, non-toxicity, and low immunogenicity. They are also widely used in medical treatments such as wound adhesion, hemostasis, leakage prevention, and adhesion prevention in various human surgical operations. In device materials. At the same time, polyethylene glycol materials can also be used as raw materials for medical devices implanted in the human body, replacing widely used plant-source, animal-source, and human-source materials, so they have a wide range of medical uses.

After the hydrogel with polyethylene glycol derivatives as its main component is sprayed onto the wound site, the gel quickly solidifies to prevent wound bleeding and infection, and then degrades on its own after the wound heals. At the same time, this hydrogel is sprayed onto the surface of organs, which can effectively prevent adhesion of internal organs during surgery and worsen the condition. Since polyethylene glycol derivatives have good biocompatibility, this process will not cause abnormal reactions in the human body; polyethylene glycol derivatives will not be absorbed by the human body, and all polyethylene glycol derivatives will eventually be metabolized Excreted from the body.
