Abstracts

The global PEG-modified Drugs (Recombinant Proteins-Polypeptides) market size is predicted to grow from US$ million in 2025 to US$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

PEG-modified drugs (recombinant proteins/polypeptides) refer to the formation of PEG-modified complexes by covalently linking polyethylene glycol molecules to recombinant proteins or polypeptide drugs. This modification can endow the drug with many beneficial properties, improving its pharmacological and biological properties.

PEG-modified drugs have the following advantages: improving drug solubility, increasing drug stability, prolonging blood drug half-life, reducing immunogenicity, and regulating drug release rate. PEG-modified drugs have been successfully used in many fields, such as antibody drugs, protein kinase inhibitors, peptide drugs, etc. They have better biocompatibility, stability and controlled release properties, which provide a new way to improve the efficacy of drugs and obtain better therapeutic effects.
