PEGylation technology involves the attachment of polyethylene glycol (PEG) polymer chains to molecules, typically proteins, peptides, or drugs. This modification enhances the therapeutic properties of the molecules by increasing their stability, solubility, and half-life in the bloodstream, while reducing immunogenicity and proteolytic degradation. PEGylation can improve drug delivery by extending the circulation time of the drugs, enabling less frequent dosing and potentially reducing side effects. This technology is widely used in developing biopharmaceuticals to enhance the efficacy and safety profiles of therapeutic agents.

The global PEGylation Technology market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
