A pellet mill roller shell is a key component within a pellet mill, playing a pivotal role in the pellet - making process. It is designed to compress and shape raw materials into pellets of a specific size, density, and quality. The roller shell, often in contact with a die, applies pressure to force the material through the die's holes, forming the pellets. Depending on the application, such as in animal feed production, biomass pellet manufacturing for energy, or pharmaceutical and chemical industries, different types of roller shells are used. They can vary in material, like cast iron, forged steel, or those with a ceramic coating, each offering distinct properties in terms of durability, strength, and wear - resistance. The surface texture also matters; smooth - surface shells are suitable for producing pellets with a uniform and smooth finish, while grooved - surface ones are better for handling fibrous or less - cohesive materials. The design of the roller shell, whether cylindrical or tapered, further influences the pellet - making process, ensuring efficient production and the creation of high - quality pellets that meet the requirements of diverse end - uses.
