The global Peltier Chillers market size is predicted to grow from US\$ 155 million in 2025 to US\$ 200 million in 2031; it is expected to grow at a CAGR of 4.4% from 2025 to 2031.

Thermoelectric recirculating chillers (also called Peltier chillers) have many benefits and advantages when compared to compressor-based chillers. Thermoelectric chillers utilize multiple arrays of thermoelectric chips (TECs) coupled with heat sinks, fans and liquid heat exchangers to provide extremely accurate thermal control of the outgoing fluid. As TECs also have the ability to heat as well as cool, thermoelectric chillers provide extremely fast and accurate temperature control and stability and can reach a temperature stability of just a few 0.01°C with a stable heat load. Compressor chillers utilize compressors with refrigerant, condensers and evaporators to provide bulk cooling and typically resistive heaters in order to counteract the on-off cooling of compressors.

Peltier chillers are widely used refrigeration devices in industries such as healthcare, research, and industrial sectors, employing the thermoelectric effect for cooling purposes. The market for Peltier chillers has been expanding steadily, driven by increasing demand, especially in biomedicine, semiconductor manufacturing, and optoelectronics. Sales continue to rise due to the continuous pursuit of efficient and reliable cooling solutions. Specific applications encompass temperature control, sample preservation, and cooling of laser equipment, among others. The future development prospects are promising, as ongoing technological innovations will enhance the capabilities of Peltier chillers across various domains to meet the growing market demands.
