## Abstracts

The report requires updating with new data and is sent in 48 hours after order is placed.

A Peltier cooling system, also known as a thermoelectric cooling system, is a type of solid-state cooling technology based on the Peltier effect. This effect describes the phenomenon where an electric current passing through the junction of two different conductive materials (semiconductors) generates a temperature difference across the junction.

In a Peltier cooling system, the device typically consists of multiple Peltier modules connected electrically in series or parallel. When a direct current is applied to these modules, one side of the junction becomes hot while the other side becomes cold, thus creating a temperature gradient.

Peltier cooling systems are commonly used in applications where traditional compressor-based cooling systems are impractical or undesirable due to their compact size, low maintenance requirements, and lack of moving parts. They are often used in small-scale cooling applications such as electronic device cooling, beverage coolers, and portable refrigerators. However, they are less efficient compared to compressor-based systems for large-scale cooling applications.

The global Peltier Cooling System market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
