The global Pendulum-type Gas Density Meter market size is predicted to grow from US\$ 45.68 million in 2025 to US\$ 58.84 million in 2032; it is expected to grow at a CAGR of 3.8% from 2026 to 2032.

A pendulum gas densitometer is an instrument used to measure gas density. The working principle of a pendulum gas densitometer is based on the vibration characteristics of a pendulum in a gas. Specifically, it suspends a pendulum in the gas to be measured, and by comparing the vibration frequency of the pendulum in the gas with the vibration frequency in a vacuum (or a gas of known density), the density of the gas to be measured can be calculated. Since the density of the gas affects the vibration characteristics of the pendulum, the density of the gas can be inferred by measuring the change in the vibration frequency.
