Peptides consist of two or more amino acids connected by amide bonds in a chain form. Covalent chemical bonds are formed when the carboxyl group of one amino acid combines with the other group of amino acid. The peptide molecules are arranged in a linear or cyclic manner. Peptide antibiotics are composed of amino acids, and hence show similarity to gene-encoded polypeptides in terms of structure and mechanism of biosynthesis. Antimicrobial peptides are widely preferred for infectious disease treatment because it consists of short link of amino acid chain (12 to 100 amino acid) and can easily be isolated from single celled microorganisms.
