The global Peptide-based Injectable Drugs market size is projected to grow from US\$ 31450 million in 2022 to US\$ 42690 million in 2029; it is expected to grow at a CAGR of 4.5% from 2023 to 2029.

Injectable peptide drugs offer several advantages over other administration routes, such as oral or topical delivery. When injected, peptides can bypass the gastrointestinal tract, avoiding issues such as degradation by stomach acid or poor absorption. Additionally, injections can provide a more rapid and direct delivery of the drug into the bloodstream, allowing for faster onset of action.

Peptide-based injectable drugs refer to medications that contain peptides as their active ingredients and are administered via injection. Peptides are short chains of amino acids, which are the building blocks of proteins. They play crucial roles in various biological processes and can be used therapeutically to target specific cellular pathways or receptors.
