The global Peptide Impurity market size is predicted to grow from US\$ 352 million in 2025 to US\$ 752 million in 2032; it is expected to grow at a CAGR of 11.7% from 2026 to 2032.

Peptide impurities are any unwanted chemical or biological substances in a target peptide sample, other than the desired target peptide sequence itself (with the correct amino acid sequence, length, stereochemistry, and post-translational modifications). These impurities arise as byproducts, incomplete starting materials, degradation products, or foreign contaminants during peptide synthesis (solid-phase synthesis or liquid-phase synthesis) or purification. They can significantly impact peptide quality, safety (especially for therapeutic or diagnostic use), and the reliability of experimental results.

Peptide impurities can originate from a variety of sources, including reaction byproducts during synthesis, unreacted starting materials, degradation products, and aggregates.

Peptide impurities themselves are non-target products. Their primary use is not as functional substances, but rather in critical processes such as quality control, analytical testing, and process optimization. While their presence primarily has negative consequences, their research and control hold significant application value.

The peptide impurity market is a key segment in the pharmaceutical supply chain, directly serving the quality control needs of peptide drugs (such as those for diabetes, oncology, and rare diseases) and high-end peptide reagents. Its growth is primarily driven by the following factors:

Explosive growth in biopharmaceuticals: Blockbuster drugs such as GLP-1 receptor agonists (such as semaglutide) and anticancer peptides are driving the global peptide drug market, leading to a surge in demand for impurity control, a core component of CMC.

Increasing regulatory barriers: The FDA/EMA/NMPA are tightening their requirements for impurity profiling, with a particular focus on genotoxic impurities (PGIs) and degradation products, forcing pharmaceutical companies to increase investment in impurity standards and analytical services.

Demand for technological iteration: The rise of complex modified peptides has led to the emergence of new impurities (such as modification site isomers), posing challenges to traditional analytical methods.

Future Trends:

High-value-added products are driving growth: Structure-confirmed impurity standards and stability-indicating method development services are becoming core profit drivers.

Accelerating technological integration: The combination of LC-HRMS (high-resolution mass spectrometry) and AI algorithms enables rapid identification and risk prediction of unknown impurities. Localized substitution opportunities: Chinese CDMO companies are accelerating their layout of high-end impurity research to break the overseas monopoly.
