Peptide therapy refers to restoring the amount of peptides to stimulate the cellular regeneration system in the body, and can be an excellent complement to small molecule and biotherapeutics as a treatment option under certain conditions. The most common uses of peptide therapy are to help build muscle and reduce fat, increase energy, improve sexual function, and reduce gastrointestinal and musculoskeletal inflammation. The most common prescription peptide combinations naturally boost growth hormone for better recovery. Peptides were initially used only for diagnostics and hormone therapy; however, as technology has advanced, they are now also widely used to treat cancer and chronic metabolic diseases. Peptides are also used in cosmeceutical operations to slow down the skin's aging process.
