The global Peptoids market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

Peptoids are peptide-mimicking polymers composed of glycine subunits in which the side chains are located on the nitrogen atoms of the amide backbone, rather than on the alpha carbon as in peptides. Peptoids lack conformational rigidity compared to alpha peptides, and the location of the monomer side chains on the amide nitrogen renders the peptoid backbone achiral. The amide bond is now tertiary, and the absence of amide protons means that the secondary structure cannot be stabilized by hydrogen bonds as in peptides. These properties make peptoids highly flexible, with properties determined by side chain characteristics and monomer sequence. Peptoid synthesis services meet the needs of target discovery and lead drug development research for peptide drugs. Peptoids have potential applications in medicine, nutrition, food, agriculture and cosmetics, and can be used as antibiotics, hormone substitutes, sports supplements and plant growth regulators.

United States market for Peptoids is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
