The global Peramivir Trihydrate market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

Peramivir trihydrate is an antiviral medication used in the treatment of influenza, particularly against the influenza A and B viruses. It belongs to the class of neuraminidase inhibitors, working by inhibiting the enzyme neuraminidase essential for the spread of the influenza virus in the body. Typically administered intravenously, peramivir trihydrate has been developed to provide a therapeutic option for individuals with severe influenza infections, offering an alternative for those unable to take oral medications. Its mechanism of action helps reduce the severity and duration of influenza symptoms when administered promptly after the onset of the illness.

The industry trend for peramivir trihydrate revolves around the ongoing need for effective antiviral treatments, especially in the context of influenza outbreaks and pandemics. As the pharmaceutical industry adapts to emerging viral strains and global health challenges, there is a continued focus on the development and improvement of antiviral medications. Trends include research into combination therapies, formulations for easier administration, and the exploration of novel delivery methods. The COVID-19 pandemic has also spurred interest in antiviral drug development, potentially influencing the trajectory of research and innovation in the broader field of antiviral therapeutics, including peramivir.
