The global Percolation Coffee Pot market size is predicted to grow from US\$ 1171 million in 2025 to US\$ 1921 million in 2032; it is expected to grow at a CAGR of 7.5% from 2026 to 2032.

Global sales of percolation coffee pots reached 23 million units in 2025, with an average price of \$51 per unit.

A percolation coffee pot is a device that uses the principle of boiling water - rising steam - repeated dripping? to extract coffee: water is heated at the bottom of the pot to form steam, which rises along the central tube and is sprayed onto coarsely ground coffee from the top. The extracted liquid then falls back to the bottom, circulating multiple times until the desired concentration is achieved. It comes with either electric heating or an open flame, with a capacity of 0.5-2 L. It offers high extraction temperatures and a rich flavor, and remains popular in North American homes, campgrounds, and nostalgic coffee shops.

The raw materials for percolation coffee pots are primarily metal: Traditional open-flame models typically use 1060 or 3003 aluminum alloy for the body, tubing, and filter, formed by stamping and stretching, followed by anodizing or food-grade enamel finishing. Electric heating models have a composite aluminum plate die-cast into the base of the aluminum kettle, embedding an aluminum die-cast heating element, and are equipped with a stainless steel central tubing, a polypropylene or PCTG transparent window, an NTC thermostat, and a power cord.

Cost structure: Aluminum ingots and die-cast aluminum parts account for 35-40% of the ex-factory price; the heating element + thermostat accounts for approximately 15%;

stainless steel tubing and plastic parts combined account for 10%; machining, surface anodizing/enamel finishing, and labor account for 12%; and testing, packaging, transportation, and distribution profits account for 20-25%.
