The global Perhydropolysilazane market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

Perhydropolysilazane (PHPS) is a highly hydrogenated polymer with a main chain composed of silicon and nitrogen atoms, and side chains composed of hydrogen atoms. This special structure gives PHPS extremely high thermal and chemical stability, allowing it to remain stable in extreme environments such as high temperatures and strong acids and bases. Therefore, PHPS is widely used for sealing, lubrication, and corrosion prevention in high-temperature environments in fields such as aerospace, automotive, electronics, and petrochemicals. Secondly, PHPS also has good electrical insulation and dielectric properties, which can be used to prepare polymer insulating green materials and dielectric materials. In addition, due to its low refractive index and good optical transparency, PHPS is also used as a coating material for optical instruments, lenses, and glasses. In addition to maintaining stability and insulation in high temperature environments, PHPS also has excellent mechanical and processing properties. It can be processed into various shapes and sizes of products, and has high hardness and wear resistance. In addition, PHPS also has good weather resistance and aging resistance, which can be used outdoors for a long time.

United States market for Perhydropolysilazane is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
