The global Periodontal Guided Tissue Regeneration Membranes market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

Periodontal Guided Tissue Regeneration (GTR) membrane is a specialized barrier used in dental and periodontal procedures to promote the regeneration of bone and tissue in areas affected by periodontal disease or trauma. The membrane is placed between the gum tissue and the bone to prevent the fast-growing gum tissue from invading the space where bone and connective tissue need to regenerate. This allows slower-growing cells from the bone and periodontal ligament to repopulate the area, facilitating the restoration of lost bone and supporting structures around the teeth. GTR membranes can be made from resorbable materials (which naturally dissolve over time) or non-resorbable materials (which require removal after healing). Their use improves the outcomes of periodontal surgeries by encouraging natural tissue regeneration and enhancing the stability of the teeth.
