Peripheral Constrained Dilation Balloon Catheter is a medical device used to treat peripheral vascular disease. It is different from traditional balloon dilation catheters in that the balloon portion of the catheter has a special constraint structure or stent, which is designed to provide more precise and controlled force when dilating blood vessels.

This constrained design is often used to treat complex vascular stenosis or occlusion, especially when more precise and local dilation and crushing of vascular plaques or calcifications are required. The constraint structure can help the catheter better control the location and force of dilation during treatment, thereby reducing the risk of damage to surrounding healthy tissues and improving the accuracy and success rate of treatment.

The global Peripheral Constrained Dilation Balloon Catheter market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
