The global Peripheral Cutting Balloon (PCB) market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

Peripheral Cutting Balloon (PCB) is designed to minimize vessel trauma with its unique mechanism of action. Peripheral cutting balloon is an interventional technique in which a balloon is inserted and scraped along the inner wall of the blood vessel. It is commonly used to treat cardiovascular diseases such as atherosclerosis. The process of a peripheral cutting balloon involves inserting a small balloon into the artery to be treated and then inflating the balloon to a certain pressure. While inflated, the balloon is pushed against the artery wall to scrape and remove the hardened material from the area. This avoids the risks of surgery while effectively restoring natural arterial shape and blood flow. Peripheral cutting balloon is generally a safe and effective treatment and has been widely adopted.

United States market for Peripheral Cutting Balloon (PCB) is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
