Peritonsillar abscess (PTA) also called quinsy. In this condition, the infection spreads behind tonsillitis. It occurs when there is pus collection and the infection spreads beyond the tonsils into the neck and chest. These swollen tissues cause airway blockage. Diagnosis can be done clinically, by laboratory investigations and by Radiological investigation. Treatment can be done using selective antibiotics and the best is by removing the abscess material. The intravenous penicillin is the choice of therapy, and hence the wide scope for the growth can be taken into consideration. The ultrasonography and computed tomographic scanning are used in the diagnosis of the disease. While needle aspiration is a gold standard method. After performing needle aspiration appropriate antibiotics therapy must be given. As Peritonsillar abscess is common in the people of young age group there is huge scope for Peritonsillar abscess treatment market. If the abscess cannot be managed by the antibiotics treatment then various surgical procedures such as needle aspiration, incision and drainage can be used. After needle aspiration, appropriate antibiotics therapy must be initiated.
