A permanent intraocular lens (IOL) is a permanent lens that is implanted into our eye(s) as a part of treatment for cataract. It is implanted during cataract surgery, after the natural cloudy lens has been removed. The lens in our eye is exactly like the lens of a camera. The lens functions to focus light onto the retina. As we age, this lens becomes rigid and cloudy, such that it starts impairing our vision. If this happens to you, you may be advised to have cataract surgery to remove the cloudy lens. The cloudy lens is replaced with an intraocular lens (IOL).
