The global Permanent Magnet Concentrator market size is predicted to grow from US$ 530 million in 2025 to US$ 866 million in 2031; it is expected to grow at a CAGR of 8.5% from 2025 to 2031.

Permanent magnetic concentrator is a device that uses the magnetic field generated by permanent magnetic materials to sort minerals. It is often used to enrich and purify magnetic minerals. Its working principle is to attract magnetic particles in the ore through the magnetic field and separate them from non-magnetic substances to achieve the purpose of mineral extraction. Due to the use of permanent magnets, no additional electrical energy is required to maintain the magnetic field. Therefore, this equipment has the advantages of low energy consumption and low operating costs. It is widely used in the beneficiation process of magnetic minerals such as iron ore and manganese ore.

As an efficient and energy-saving mineral processing equipment, the permanent magnet mineral concentrator plays an increasingly important role in modern mining due to its characteristic of maintaining a magnetic field without the need for additional power supply. Compared with traditional electromagnetic mineral processing equipment, permanent magnet mineral concentrators can not only significantly reduce energy consumption, but also have stable and reliable operating performance, reducing equipment maintenance costs. In addition, it shows higher sorting accuracy and recovery rate in processing magnetic minerals, and has strong adaptability. It has been widely used especially in the field of mineral sorting such as iron ore and ilmenite. With the development of magnetic material technology, permanent magnet concentrators
