Permanent magnet reducer is a gearbox that uses permanent magnet to reduce motor speed and increase torque output. The reducer is composed of a housing, a set of gears and a permanent magnet motor. Permanent magnet motor is a brushless DC motor, which is famous for its high efficiency, high power density and low maintenance requirements. The permanent magnet inside the motor generates a magnetic field, which interacts with the magnetic field generated by the stator winding, causing the

rotor to rotate. The gear in the reducer transmits torque from the motor to the output shaft, which can be used to drive various types of machinery. Permanent magnet reducers are famous for their high efficiency, because they have fewer moving parts than traditional gearboxes, and do not require separate motor and speed control. They are also known for their high power density, which means that they can transmit a large amount of torque in relatively small packages.
