Permeable pavers mimic the natural process that occurs on the ground's surface. The role of a segmental permeable pavement system is to allow water to pass through the paving stones joints and seep into the ground naturally, or to be retained in the base/subbase structure rather than turning into runoff headed directly into the sewer system. It also filters out suspended solids and pollutants such as contaminants from vehicles, de-icing salt and chemical products, keeping them from polluting the water stream.
