Abstracts

The global Persistent Epithelial Defect Management market size is predicted to grow from US$ 5015 million in 2025 to US$ 11410 million in 2032; it is expected to grow at a CAGR of 12.7% from 2026 to 2032.

With the global aging population and the increasing prevalence of chronic diseases such as diabetes and hypertension, the incidence of PED is rising. Advancements in diagnostic technologies and increased patient awareness have enabled early detection and intervention. Innovations in biologic therapies, stem cell treatments, and regenerative medicine are providing new avenues for PED management.

Despite advancements, PED treatment faces challenges such as high costs and limited accessibility. Therapies like amniotic membrane transplantation and autologous serum eye drops are effective but expensive and may not be readily available in all regions. Additionally, the variability in treatment responses among patients necessitates personalized treatment approaches, which require further research and development.

Patients are increasingly seeking treatments that not only restore vision but also ensure safety and comfort. Non-invasive therapies with minimal side effects, such as ocular biologics and stem cell-based treatments, are gaining popularity. Healthcare providers are focusing on personalized treatment plans to cater to individual patient needs, enhancing therapeutic outcomes and patient satisfaction.

The primary raw materials for PED treatment include amniotic membrane, stem cells, and recombinant growth factors. Amniotic membrane, a biological material, possesses excellent biocompatibility and promotes tissue repair, making it widely used in PED treatment. Stem cells, particularly mesenchymal stem cells, have self-renewal and multi-

directional differentiation capabilities, serving as crucial components in PED therapy. Recombinant growth factors, such as recombinant nerve growth factor (rhNGF), play a significant role in promoting the proliferation and migration of corneal epithelial cells.
