Personalized orthopedic solutions refer to comprehensive medical services that tailor orthopedic implants, surgical guides, and preoperative planning based on a patient's anatomical structure, pathological characteristics, and biomechanical needs, utilizing medical imaging, 3D printing, and computer-aided design technologies. The core of this approach lies in reconstructing a three-dimensional model of the patient's skeleton using CT/MRI data, designing and manufacturing customized implants (such as joint prostheses and spinal fixation devices) or surgical guides that perfectly match the patient's anatomy, achieving precise implantation and optimal biomechanical fit. This solution encompasses the entire process, from preoperative simulation and implant design and manufacturing to surgical navigation and postoperative evaluation. Its core value lies in solving the problem of mismatch between standardized prostheses and complex anatomy, improving surgical precision, shortening operation time, and enhancing long-term efficacy. It is widely used in complex joint revision surgeries, bone tumor resection and reconstruction, and severe deformity correction, among other challenging orthopedic procedures.
