The global Pervaporation Membrane Module market size is predicted to grow from US\$ 169 million in 2025 to US\$ 239 million in 2031; it is expected to grow at a CAGR of 6.0% from 2025 to 2031.

The impact of the latest U.S. tariff measures and the corresponding policy responses from countries worldwide on market competitiveness, regional economic performance, and supply chain configurations will be comprehensively evaluated in this report.

Pervaporation is a membrane separation technology based on the physico-chemical interaction between the membrane and the permeating molecules. Highly hydrophilic materials, like polyvinyl alcohol, enhance selective sorption and diffusion of water through a thin dense membrane layer. Therefore, pervaporation is ideally suited for the dehydration of solvent mixtures, especially azeotropes where conventional technologies, like distillation, require complex and energy-intensive processes.
