Permeable Pavement is a specific type of pavement with a high porosity that allows rainwater to pass through it into the ground below. Pervious pavement is made of either pervious asphalt or pervious concrete. Both materials resemble conventional asphalt and concrete, but have more air spaces that allow water to pass through the pavement into a reservoir base of crushed aggregate, then infiltrate into the ground. Pervious pavement is designed to accept precipitation only and is typically thicker than traditional concrete to support the same loads. This report focuses on the Pervious Pavement materials.
