The global PET Enzymatic Depolymerization market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

PET enzymatic depolymerization is a sustainable process that uses specific enzymes to break down polyethylene terephthalate (PET), a common plastic, into its monomeric components. Unlike traditional recycling methods, which involve high temperatures and chemicals, enzymatic depolymerization leverages naturally occurring or engineered enzymes to catalyze the hydrolysis of PET polymers into their constituent monomers, such as terephthalic acid and ethylene glycol. This approach offers a more energy-efficient and environmentally friendly alternative to mechanical recycling or chemical processes, as it operates under milder conditions and can potentially yield higher-quality recycled materials. By enabling the recovery and reuse of PET at a molecular level, enzymatic depolymerization supports circular economy goals and reduces plastic waste in the environment.

United States market for PET Enzymatic Depolymerization is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.

China market for PET Enzymatic Depolymerization is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
