According to this study, the global Pet Insulin Pump market size will reach US\$ million by 2029.

Diabetes is a syndrome related to hyperglycemia, which is caused by insufficient insulin secretion from pancreatic beta cells, decreased insulin sensitivity of peripheral tissues leading to insulin resistance, or both. Once people develop diabetes, they need lifelong medication, and the same goes for dogs and cats. As a common internal disease in dogs and cats, in recent years, more and more pets are suffering from diabetes in dogs and cats. According to a review of the 2018 Canine and Feline Diabetes Management Guidelines by the American Animal Hospital Association (AAHA), risk factors for diabetes in dogs and cats include obesity, certain diseases, such as feline acromegaly, feline Kidney disease, canine hyperadrenalism, dental disease in dogs and cats, pancreatitis, etc.; or insulin resistance caused by certain drugs, such as steroids, progestins, cyclosporine, etc.; pet genes are also an important risk factor, and certain breeds of dogs, such as beagles, Samoyeds, Keeshonds, and cats (such as Burmese cats) are more susceptible. Typical symptoms of diabetes in dogs and cats include 'three more and one less', polydipsia, polyuria, polyphagia, and weight loss, fat transfer, increased hepatic lipid deposition, hepatomegaly, hypercholesterolemia, and hypertriglyceridemia. Symptoms and catabolism increase; if not strictly controlled, ketonemia, ketonuria and ketoacidosis poisoning will eventually occur, leading to progressive damage to pet health.
