The global PET Optical Base Film market size is predicted to grow from US\$ 1242 million in 2025 to US\$ 1897 million in 2032; it is expected to grow at a CAGR of 6.3% from 2026 to 2032.

In 2025, global production of PET optical base film reached 407,000 tons, with an estimated average selling price of US\$3,120 per ton. PET optical base film is an optical-grade biaxially oriented polyester film made primarily from polyethylene terephthalate (PET) through processes such as melt extrusion, casting, biaxial stretching, heat setting, online coating, slitting, and clean packaging. It is mainly used as a base carrier for optical functional films, electronic release films, and display materials, emphasizing high light transmittance, low haze, low crystal point, low fisheye, low thickness deviation, high cleanliness, high surface smoothness, good coating adhesion, dimensional stability, and heat resistance. The upstream of the industry chain mainly includes PTA, MEG, PET optical-grade chips, masterbatch, antistatic/easy-adhesion coating solutions, functional additives, filtration systems, cleanroom equipment, biaxial stretching production lines, and online testing systems; the midstream involves PET optical base film manufacturing, surface treatment, cleanroom slitting, and quality inspection; the downstream includes polarizers, diffusion films, brightness enhancement films, reflective films, hardening films, OCA optical adhesives, MLCC release films, touch modules, LCD/OLED displays, Mini/Micro LED backlights, consumer electronics, automotive displays, photovoltaic backsheets, and electronic materials. Gross profit margins range from approximately 20% to 40%.

Regionally, the Asia-Pacific region is a major global hub for both production and consumption, with China, Japan, South Korea, and Taiwan forming the core industrial cluster. Japanese companies maintain a technological edge in high-end polarizers,

display optics, and specialty polyester films, while South Korean firms possess strong capabilities in supplying base films for FPD optical sheets. Mainland China has rapidly expanded production capacity by leveraging supply chains for display panels, MLCCs, consumer electronics, photovoltaics, and next-generation displays, becoming the primary market for capacity additions and domestic substitution. Europe and North America focus primarily on high-end specialty polyester films, electronic materials, automotive displays, industrial optics, and supplies for brand-name clients; while their market scale remains relatively stable, the barriers to entry—particularly regarding technology—are high. Key industry trends include: first, the shift toward larger display panels and multi-screen automotive setups, alongside the adoption of Mini LED backlighting and the localization of high-end polarizers, is driving demand for base films characterized by high cleanliness and superior flatness; second, the evolution of MLCC release films toward ultra-thin profiles, high smoothness, and low defect rates is boosting demand for electronic-grade optical base films; and third, downstream customers are demanding improved performance—such as reduced rainbow effects and haze, higher light transmission, better coating adhesion, and antistatic properties—compelling base film manufacturers to pursue functionalization and customization.
