The natural deodorant is atomized by the deodorizing equipment to form a mist, and the radius of the dispersed droplets in the space is less than or equal to 0.04mm. The droplet has a large specific surface area and a large surface energy, with an average of about tens of kilocalories per mole, and the energy of this order of magnitude is already 1/3-1/4 of the bond energy in many elements. The surface of the solution can not only effectively absorb the odor molecules in the air, but also change the three-dimensional configuration of the adsorbed odor molecules, weaken the bond in the odor molecules, and increase the instability of the odor molecules. Reacts chemically with other molecules and with acidic buffers in plant juices, resulting in an odorless, non-toxic substance. For example, hydrogen sulfide reacts under the action of plant sap to generate sulfate ions and water; ammonia under the action of plant sap generates nitrogen and water.
