## Abstracts

The global Petrochemical Heat Recovery Steam Generator market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

The Petrochemical Heat Recovery Steam Generator (HRSG) is a specialized device used in petrochemical and refining industries to recover waste heat generated during the production process. It utilizes the hot exhaust gases from combustion engines, furnace flue gases, or other high-temperature streams to produce steam. This steam can then be used for various purposes such as power generation or heating, thereby improving energy efficiency and reducing greenhouse gas emissions. The HRSG captures and harnesses the waste heat, converting it into useful energy, making it an essential component in petrochemical plants and refineries for maximizing energy utilization and minimizing environmental impact.

The market prospect for Petrochemical Heat Recovery Steam Generators (HRSGs) is promising, driven by the increasing focus on energy efficiency and sustainability in the petrochemical and refining industries. These industries generate significant amounts of waste heat during production processes, making the HRSGs essential for capturing and utilizing this heat to produce steam for power generation or heating purposes. The demand for HRSGs is expected to grow as companies strive to reduce their carbon footprint, optimize energy utilization, and comply with strict environmental regulations. Additionally, the increasing adoption of cogeneration and combined heat and power systems further boosts the market for Petrochemical HRSGs, creating opportunities for manufacturers and suppliers in the industry.
